Section

A bank wants to decide whether to approve a loan (Yes/No) for customers based on the following categorical features:

- Age_Group: {Youth, Middle-aged, Senior}
- Income_Level: {High, Medium, Low}
- Student: {Yes, No}
- Credit_History: {Good, Bad}

Age_Group	Income_Level	Student	Credit_History	Approve_Loan
Youth	High	No	Good	No
Youth	High	Yes	Bad	No
Youth	Medium	Yes	Good	Yes
Youth	Medium	No	Bad	No
Senior	Low	Yes	Good	Yes
Senior	Low	No	Good	No
Senior	Medium	Yes	Bad	No
Senior	Medium	No	Bad	No
Middle-aged	High	Yes	Good	Yes
Middle-aged	High	No	Good	No
Middle-aged	Low	Yes	Bad	No
Middle-aged	Low	No	Good	Yes

1. Compute the entropy of the dataset with respect to the target Approve_Loan.
2. Calculate the **information gain** for each attribute and select the root node.
3. Construct a **decision tree** (ID3 algorithm) until all leaves are pure or no attributes remain.

4. Using your tree, predict the loan decision for a new customer:

- Age_Group = Senior, Income_Level = Low, Student = Yes, Credit_History = Bad.

$$\Rightarrow \text{Entropy (Approved Loan)} = -P_{\text{yes}} \log_2 P_{\text{yes}} - P_{\text{no}} \log_2 P_{\text{no}}$$

$$= -\frac{4}{12} \log_2 \frac{4}{12} - \frac{8}{12} \log_2 \frac{8}{12} = \underline{\underline{0.9183}} \checkmark$$

Age Group:

$$\text{Entropy (Youth)} = -P_{(\text{yes}|\text{Youth})} \log_2 P_{(\text{yes}|\text{Youth})} - P_{(\text{no}|\text{Youth})} \log_2 P_{(\text{no}|\text{Youth})}$$

$$= -\frac{1}{4} \log_2 \frac{1}{4} - \frac{3}{4} \log_2 \frac{3}{4} = 0.8113$$

$$\therefore \text{IG (Age Group)} = 0.9183 - \left(0.8113 \times \frac{4}{12} + 0.8113 \times \frac{4}{12} + 1 \times \frac{4}{12} \right)$$

$$= \underline{\underline{0.0441}} \checkmark$$

Income level:

$$\text{Entropy (High)} = 0.8113 \quad \text{Entropy (Medium)} = 0.8113 \quad \text{Entropy (Low)} = 1$$

$$\therefore \text{IG (Income Level)} = 0.0441 \checkmark$$

Student: $\text{Entropy (Yes)} = 1$ $\text{Entropy (No)} = -\frac{1}{6} \log_2 \frac{1}{6} - \frac{5}{6} \log_2 \frac{5}{6} = 0.6500$

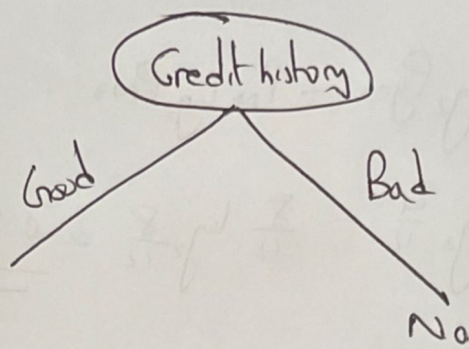

$$\therefore \text{IG (Student)} = 0.9183 - \left(1 \times \frac{6}{12} + 0.6500 \times \frac{1}{12} \right)$$

$$= \underline{\underline{0.0933}} \checkmark$$

Credit history: $\text{Entropy (Good)} = -\frac{4}{7} \log_2 \frac{4}{7} - \frac{3}{7} \log_2 \frac{3}{7} = 0.9852$

$$\text{Entropy (Bad)} = 0$$

$$\therefore \text{IG} = 0.9183 - \left(0.9852 \times \frac{7}{12} \right) = \underline{\underline{0.343}} \checkmark$$

∴ Now consider table with credit history Good.

$$\text{Entropy (Approved loan)} = -\frac{4}{7} \log_2 \frac{4}{7} - \frac{3}{7} \log_2 \frac{3}{7} = \underline{\underline{0.9852}} \checkmark$$

Age Group:

$$\text{Entropy (Youth)} = 1 \quad \text{Entropy (Senior)} = 1 \quad \text{Entropy (Middle Aged)} =$$

$$\text{Entropy (Middle Aged)} = -\frac{2}{3} \log_2 \frac{2}{3} - \frac{1}{3} \log_2 \frac{1}{3} = 0.9183$$

$$\begin{aligned} \therefore IG(\text{Age}) &= 0.9852 - \left(1 \times \frac{2}{7} + 1 \times \frac{2}{7} + 0.9183 \times \frac{3}{7}\right) \\ &= \underline{\underline{0.0202}} \checkmark \end{aligned}$$

Income level:

$$\text{Entropy (High)} = -\frac{1}{3} \log_2 \frac{1}{3} - \frac{2}{3} \log_2 \frac{2}{3} \quad \text{Entropy (medium)} = 0$$

$$= \underline{\underline{0.9183}} \checkmark$$

$$\text{Entropy (Low)} = 0.9183$$

$$\begin{aligned} \therefore IG(\text{Income level}) &= 0.9852 - \left(0.9183 \times \frac{3}{7} + 0.9183 \times \frac{3}{7}\right) \\ &= \underline{\underline{0.198}} \checkmark \end{aligned}$$

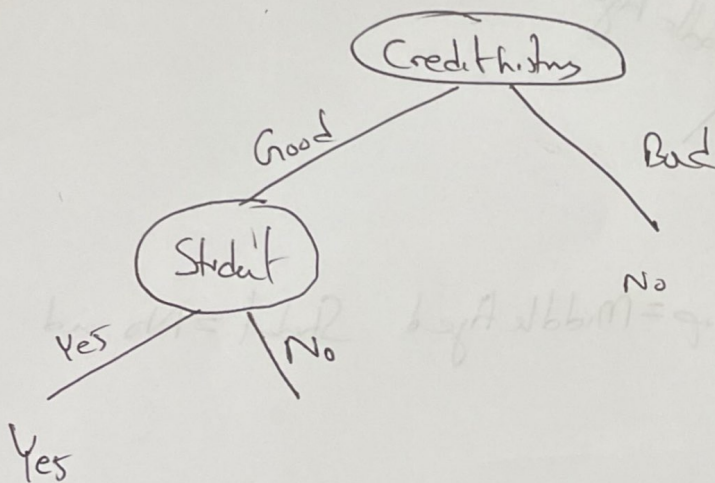

Student:

$$\text{Entropy}(\text{Yes}) = 0$$

$$\text{Entropy}(\text{No}) = -\frac{1}{4} \log_2 \frac{1}{4} - \frac{3}{4} \log_2 \frac{3}{4} = 0.8112$$

$$\therefore IG(\text{Student}) = 0.9852 - \left(0.8112 \times \frac{4}{2}\right)$$

$$= 0.5217 \quad \checkmark$$

Now consider student = No and Credit history = Good

$$\text{Entropy}(\text{Approved Loan}) = 0.8113 \quad \checkmark$$

Age Group:

$$\text{Entropy}(\text{Youth}) = 0$$

$$\text{Entropy}(\text{Senior}) = 0$$

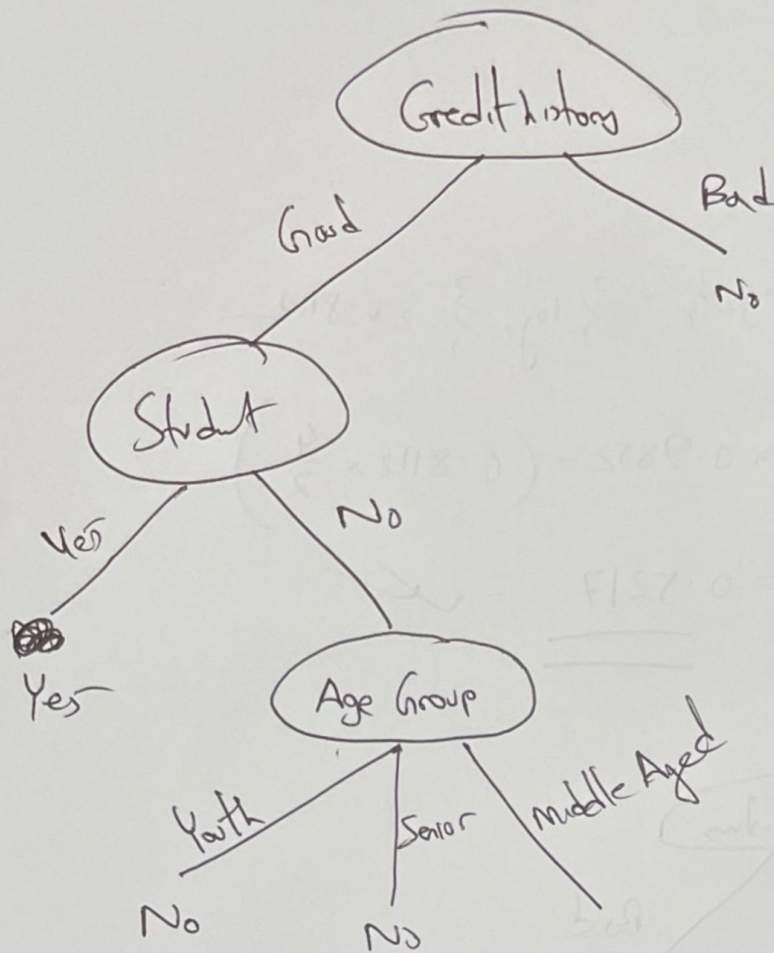

$$\text{Entropy}(\text{Middle Aged}) = 1$$

$$IG(\text{Age Group}) = 0.8113 - \left(1 \times \frac{2}{4}\right)$$

$$= 0.3113 \quad \checkmark$$

Income Level: $\text{Entropy}(\text{High}) = 0$ $\text{Entropy}(\text{Low}) = 1$

$$\therefore IG = 0.8113 - \left(1 \times \frac{2}{4}\right) = 0.3113 \quad \checkmark$$

∴ Now considering Age Group = Middle Aged Student = No and Credit history = Good.
